

# How Websites Work?

A Website is made of some basic files, called HTML, CSS and JS.

- **HTML:** The HTML is responsible to the content of a website, so if the website is a house, the HTML will be the bricks of the house
- **CSS:** This is responsible to the styling of the website, so if the website is a house, the CSS will be the painting of the house
- **JS:** The JS is responsible to the website to do things, to have functionality, so if the website is a house, the JS will be like adding lightning bulbs, that can be turned on and off
